

Introduction

Businesses of all sizes need to gain competitive advantage by increasing productivity and efficiency, managing costs and getting the maximum return on investment. Providing mobile and remote workers with access to key business applications delivers higher employee productivity and efficiency by enabling employees to maximise their work time, by improving information flows and by enabling the business to respond quickly in a dynamic environment.

The AccessMyLan Web Portal provides an easy and secure way to enable remote access to e-mail, files and web applications from any Internet browser. With no software to install, the Web Portal provides a simple yet safe way of providing access for staff and business partners from home PCs, Internet kiosks and desktops not under the control of your organization.

Technical Overview

The AccessMyLan Web Portal secures access from any JavaScript enabled browser using SSL/TLS to webmail, WebDAV file shares and web applications located in the office network. Upon login from a browser, the Web Portal presents the remote user with a dynamically generated portal page containing the applications and file shares that have been published by the VPN Administrator.

The Web Portal is a reverse proxy that implements user authentication, access controls and session management, removing the need to open ports on the corporate firewall and expose internal servers to the Internet.

Publishing Applications

The VPN Administrator publishes applications to the Web Portal by defining the servers and applications to be published and optionally applying user and URL access controls. Access can be further restricted through the dynamically loaded 'VPN Plugin' which determines the status of the browser host and quarantines non-compliant sessions.

AccessMyLan has improved our service levels to our external employees. Its ease of deployment and ease of admin make this product a brilliant addition to the services we offer to our internal customers
